

Am I forgetful or is it Alzheimer's?

Early detection is important in slowing the progression of memory loss.

Join Courtyard Alzheimer's Assisted Living for our FREE Alzheimer's Symposium, addressing the importance of early dementia screening in the treatment of Alzheimer's Disease. The sooner symptoms are detected and diagnosed, the more treatment options are available. In some cases, the symptoms might even be caused by a physical illness that can be treated and even reversed – if detected early.

Learn about the GrayMatters® Assessment System and steps you can take to detect Alzheimer's early. The assessment is a simple memory screening test that takes about 30 minutes, with results available quickly for you and your doctor to review. Screening is recommended every one-to-two years for people in their 60s, and annually for those ages 70 and older. Annual screenings should begin earlier for those who are at a greater risk.

CHRISTIAN CARE CENTER

Christian Care Centers

MESQUITE, TEXAS
